The Material Costs workspace brings existing JobBOSS material values together in an editable grid. Detail from the full interface.

## Make routine material updates easier

Correct a few records directly in the grid, or export a selected group to Excel, prepare your changes and import them back into JobBOSS. Neptune's Material Cost and Price Manager gives purchasing, estimating, sales and finance a repeatable way to keep their material data current.

- **Quick individual changes.** Review several materials together and update the values that need attention.
- **Efficient batch maintenance.** Use Excel for supplier revisions, periodic selling-price updates and broader data changes.
- **Clear follow-through.** Validate the import and review pricing change history after the update.

CHOOSE YOUR VERSION

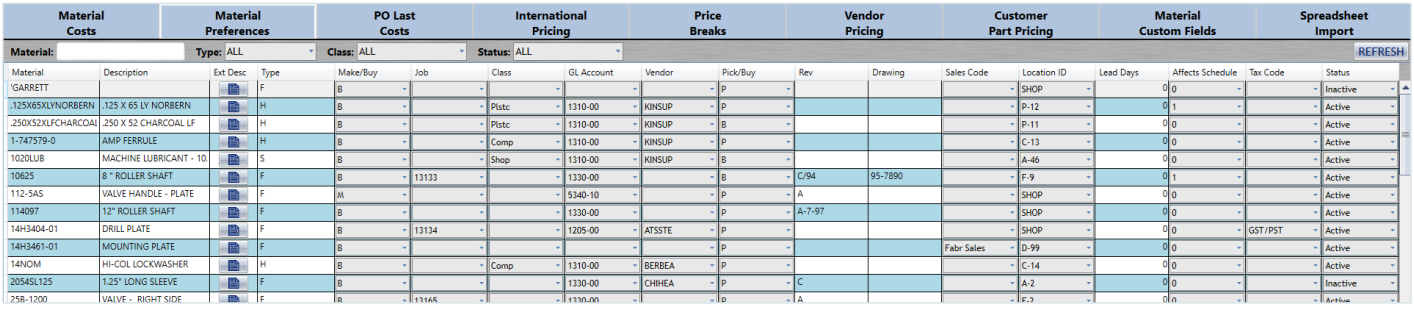

# Two versions for different needs

Use the Standard version for cost and price maintenance. Add Material Preferences when your team also manages the wider material record.

| Capability | Standard | With Material Preferences |
|---|---|---|
| Standard, average and last cost; selling price | Included | Included |
| Reorder point and reorder quantity | Included | Included |
| Excel export and import workflows | Included | Included |
| Quantity price breaks and customer part pricing | Included | Included |
| Historical material costing report | Included | Included |
| Material preference fields and related export/import | - | Included |
| Material custom fields and related export/import | - | Included |

## Extend the workflow to material preferences

The version with Material Preferences adds material defaults and custom fields. Maintain class, primary vendor, GL account, make/buy and pick/buy settings, revision, drawing, lead days and status. Update a product family, replace a default vendor or standardize your material records.

Material Preferences provides an expanded view of the material record. The illustration shows part of the full screen.

Both versions work with existing JobBOSS material records, including raw stock and finished goods. Available screens and reports follow the configuration installed for your company.

TYPICAL WORKFLOWS

# A repeatable process your team can use

Choose the route that fits the size of the update, then verify the result in JobBOSS.

## For a handful of changes

Open the utility, narrow the material list and edit the required values. Complete the row to save the change. This is a direct way to handle an individual correction or a small set of materials without preparing a spreadsheet.

## For a larger update

1. **Export the right records**
   Run the corresponding Neptune export report from JobBOSS and choose Excel Data Only.
2. **Prepare the changes in Excel**
   Keep the materials you intend to update, calculate or enter the new values and retain the report's column structure.
3. **Import and check the result**
   Use the matching import option in the utility, resolve any validation messages and verify representative records and pricing history.

## Useful across the business

- **Purchasing:** maintain material costs after supplier changes and keep replenishment values organized.
- **Sales and estimating:** apply agreed selling-price changes across a product group.
- **Finance and material administration:** review pricing changes and maintain consistent material defaults with the Preferences version.

## Training and product information

**Watch the recorded product webinar**

See the utility in use. The recording opens through GoTo Webinar registration.

The companion **Material Cost and Price Manager Training Guide** covers direct edits, Excel updates, material preferences, audit history and common questions. Keep it with your team's working files for reference.
